

CloudPlatform - Getting Started Guide

Overview

CloudPlatform is an intelligent cloud orchestration and API workflow management platform designed for engineering and product teams. It allows teams to deploy serverless workflows, manage microservices, and automate customer pipelines with zero DevOps overhead.

Account Setup & Registration

1. Visit <https://cloudplatform.example.com/signup>
2. Enter your work email, username, and secure password (minimum 8 characters, at least 1 number and 1 special symbol).
3. Check your email inbox for a 6-digit verification code. Enter this code within 15 minutes.
4. Set up Multi-Factor Authentication (MFA) using any standard authenticator app (Google Authenticator, Authy, or 1Password).

System Requirements

- Operating Systems: Windows 10/11 (64-bit), macOS 12.0+ (Apple Silicon or Intel), Ubuntu 20.04+ / Debian 11+.
- CLI Requirements: Node.js v18+ or Python 3.10+ (if using Python SDK).
- Network: Outbound HTTPS (Port 443) access to api.cloudplatform.example.com.

Quickstart: Installing the CLI

Run the following command to install the CloudPlatform CLI globally via npm:

```
npm install -g @cloudplatform/cli
```

Or with Python pip:

```
pip install cloudplatform-cli
```

First Project Deployment

1. Authenticate your CLI: `cloudplatform login`
2. Initialize your workspace: `cloudplatform init my-project`
3. Deploy to production: `cloudplatform deploy --env production`
