

CloudPlatform - Troubleshooting & Common Errors

Error: 401 Unauthorized (AUTH_INVALID_TOKEN)

Symptoms: CLI commands or API requests fail with HTTP status code 401 Unauthorized and message 'Invalid or expired authorization token'.

Cause: Your session token has expired after 30 days of inactivity, or API Key was revoked or deleted in the admin dashboard.

Resolution Steps:

1. Re-authenticate CLI: `cloudplatform logout && cloudplatform login --force`
2. If using an API key in automated environments, generate a new secret key under Dashboard > Developer Settings > API Keys.
3. Verify your environment variable `CLOUDPLATFORM_API_KEY` is loaded correctly.

Error: 429 Too Many Requests (RATE_LIMIT_EXCEEDED)

Symptoms: API returns 429 Too Many Requests.

Cause: You exceeded the rate limits of your plan (Free: 60 req/min, Pro: 600 req/min, Enterprise: Configurable/Unlimited).

Resolution Steps:

1. Implement exponential backoff with jitter in your client application (e.g. retry after 1s, 2s, 4s).
2. Check the Retry-After HTTP header returned by the API server.
3. If higher throughput is needed, upgrade your plan under Billing > Change Plan.

Error: Deployment Timeout (DEPLOY_TIMEOUT_ERR)

Symptoms: Deployment hangs for more than 10 minutes and fails with 'Deployment timed out waiting for healthcheck'.

Cause: Application failed to bind to `0.0.0.0:$PORT`, health check endpoint `/healthz` returned non-200 status, or heavy build step.

Resolution Steps:

1. Ensure your server listens on `0.0.0.0` and uses `$PORT` (default 8080).
2. Test healthcheck locally: `curl -I http://localhost:8080/healthz`
3. Check deployment logs with: `cloudplatform logs --deployment <DEPLOYMENT_ID> --tail 100`

Resetting Your Password / Locked Account

If your account is locked due to multiple failed login attempts:

1. Go to <https://cloudplatform.example.com/forgot-password>
2. Enter your account email address.
3. Follow the reset link sent to your email within 30 minutes.
4. If you do not receive the email, check spam or contact support.
